## CONSORT 2010

The CONSORT (CONsolidated Standards of Reporting Trials) 2010 guideline is intended to improve the reporting of parallel-group randomized controlled trial (RCT), enabling readers to understand a trial's design, conduct, analysis and interpretation, and to assess the validity of its results. This can only be achieved through complete adherence and transparency by authors.

CONSORT 2010 was developed through collaboration and consensus between clinical trial methodologists, guideline developers, knowledge translation specialists, and journal editors (see [CONSORT group](#)). CONSORT 2010 is the current version of the guideline and supersedes the 2001 and 1996 versions. It contains a 25-item [checklist](#) and [flow diagram](#), freely available for viewing and [downloading](#) through this website.

Science Foundation Ireland joins DORA

14th February 2019, Dublin – Science Foundation Ireland has become a signatory to the San Francisco Declaration of Research Assessment (DORA), making a formal commitment to assessing the quality and impact of research through means other than journal impact factors.

# Tomorrow

# FAIR is a part of your life now!

## Data Guidelines

1. Background
  - 1.1 Open Data Policy
  - 1.2 Fair Data Principles

2. Share Your Data in 3 Steps
  - 2.1 Prepare Your Data for Sharing
  - 2.2 Select a Repository
  - 2.3 Add a Data Availability Statement to Your Manuscript
  - 2.4 Linking your datasets to your article

Some types of data benefit from visualization within the article. Wellcome Open Research welcomes the submission of manuscripts featuring [Plot.ly interactive figures](#) and [Code Ocean compute capsules](#). For further detail, please [contact us](#).

## Research Data Management

Good data governance and stewardship are key components of good research practice. In this regard, Science Foundation Ireland supports that research data should be Findable, Accessible, Interoperable and Reusable (FAIR)\*. Appropriate data management and data sharing are fundamental to all stages of the research process and support high quality, reproducible research. As such, access to research data arising in whole or in part from SFI funding should be as open as possible.

### FAIR Data Management

Describe the approach to data management that will be taken during and after the project, including who will be responsible for data management and data stewardship. The word limit is 500 words.

## Social Research Ethics Committee (SREC) ETHICS APPROVAL FORM

✉ [srec@ucc.ie](mailto:srec@ucc.ie)

<https://www.ucc.ie/en/research/about/ethics/>

<sup>4</sup> Data management should follow the FAIR guiding principles (Findability, Accessibility, Interoperability & Reusability). See, for example, Wilkinson, M. D. et al. (2016) The FAIR Guiding Principles for Scientific Data Management and Stewardship. Full text: <http://www.nature.com/articles/sdata201618>. It is required that all staff and student researchers store those data which are required to replicate research findings, and the information required to enable re-use of data. Details of the UCC policy on research data storage can be found in section 8 of the Code of Research Conduct (2016): <https://www.ucc.ie/en/media/research/researchatucc/documents/UCCCodeofResearchConduct.pdf>. SREC advises against storing research data on non UCC approved cloud-based storage services. Physical data must be stored in a locked cabinet and you must specify who has permission to access this data.

A set of Digital Object Compliance principles that describes the properties of digital objects that enables them to be findable, accessible, interoperable and reproducible (FAIR).

# What are the FAIR data principles

The screenshot shows a journal article from the SCIENTIFIC DATA journal. The title of the article is "Comment: The FAIR Guiding Principles for scientific data management and stewardship" by Mark D. Wilkinson et al. The article discusses the need to improve the infrastructure supporting the reuse of scholarly data. It highlights the FAIR Data Principles as a set of guidelines for enhancing data reusability. The article is open access and includes subject categories such as Research data and Publication characteristics. It was received on December 10, 2015, accepted on February 12, 2016, and published on March 15, 2016. The text is presented in a clean, modern layout with a blue header and white background.

Comment: The FAIR Guiding Principles for scientific data management and stewardship

Mark D. Wilkinson et al.\*

Received: 10 December 2015  
Accepted: 12 February 2016  
Published: 15 March 2016

There is an urgent need to improve the infrastructure supporting the reuse of scholarly data. A diverse set of stakeholders—representing academia, industry, funding agencies, and scholarly publishers—have come together to design and jointly endorse a concise and measurable set of principles that we refer to as the FAIR Data Principles. The intent is that these may act as a guideline for those wishing to enhance the reusability of their data holdings. Distinct from peer initiatives that focus on the human scholar, the FAIR Principles put specific emphasis on enhancing the ability of machines to automatically find and use the data, in addition to supporting its reuse by individuals. This Comment is the first formal publication of the FAIR Principles, and includes the rationale behind them, and some exemplar implementations in the community.

**Supporting discovery through good data management**

Good data management is not a goal in itself, but rather is the key conduit leading to knowledge discovery and innovation, and to subsequent data and knowledge integration and reuse by the community after the data publication process. Unfortunately, the existing digital ecosystem surrounding scholarly data publication prevents us from extracting maximum benefit from our research investments (e.g., ref. 1). Partially in response to this, science funders, publishers and governmental agencies are beginning to require data management and stewardship plans for data generated in publicly funded experiments. Beyond proper collection, annotation, and archival, data stewardship includes the notion of ‘long-term care’ of valuable digital assets, with the goal that they should be discovered and re-used for downstream investigations, either alone, or in combination with newly generated data. The outcomes from good data management and stewardship, therefore, are high quality digital publications that facilitate and simplify this ongoing process of discovery, evaluation, and reuse in downstream studies. What constitutes ‘good data management’ is, however, largely undefined, and is generally left as a decision for the data or repository owner. Therefore, bringing some clarity around the goals and desiderata of good data management and stewardship, and defining simple guideposts to inform those who publish and/or preserve scholarly data, would be of great utility.

This article describes four foundational principles—Findability, Accessibility, Interoperability, and Reusability—that serve to guide data producers and publishers as they navigate around these obstacles, thereby helping to maximize the added-value gained by contemporary, formal scholarly digital publishing. Importantly, it is our intent that the principles apply not only to ‘data’ in the conventional sense, but also to the algorithms, tools, and workflows that led to that data. All scholarly digital research objects—from data to analytical pipelines—benefit from application of these principles, since all components of the research process must be available to ensure transparency, reproducibility, and reusability.

There are numerous and diverse stakeholders who stand to benefit from overcoming these obstacles: researchers wanting to share, get credit, and reuse each other’s data and interpretations; professional data publishers offering their services; software and tool-builders providing data analysis and processing services such as reusable workflows; funding agencies (private and public) increasingly

Correspondence and requests for materials should be addressed to B.M. (email: barend.mons@dtls.nl).

# Incorporating FAIR into your routine workflow

F1000

## Your go-to guide to making your data Findable, Accessible, Interoperable, and Reusable (FAIR)

So that you and others can get the most out of your data, it is important that you adhere to the [FAIR principles](#) to ensure your data are **Findable, Accessible, Interoperable, and Reusable** – whilst making your data openly available where it is safe to do so. This is no small task, so here are some ideas to help you get started:

1

### Start with a management plan

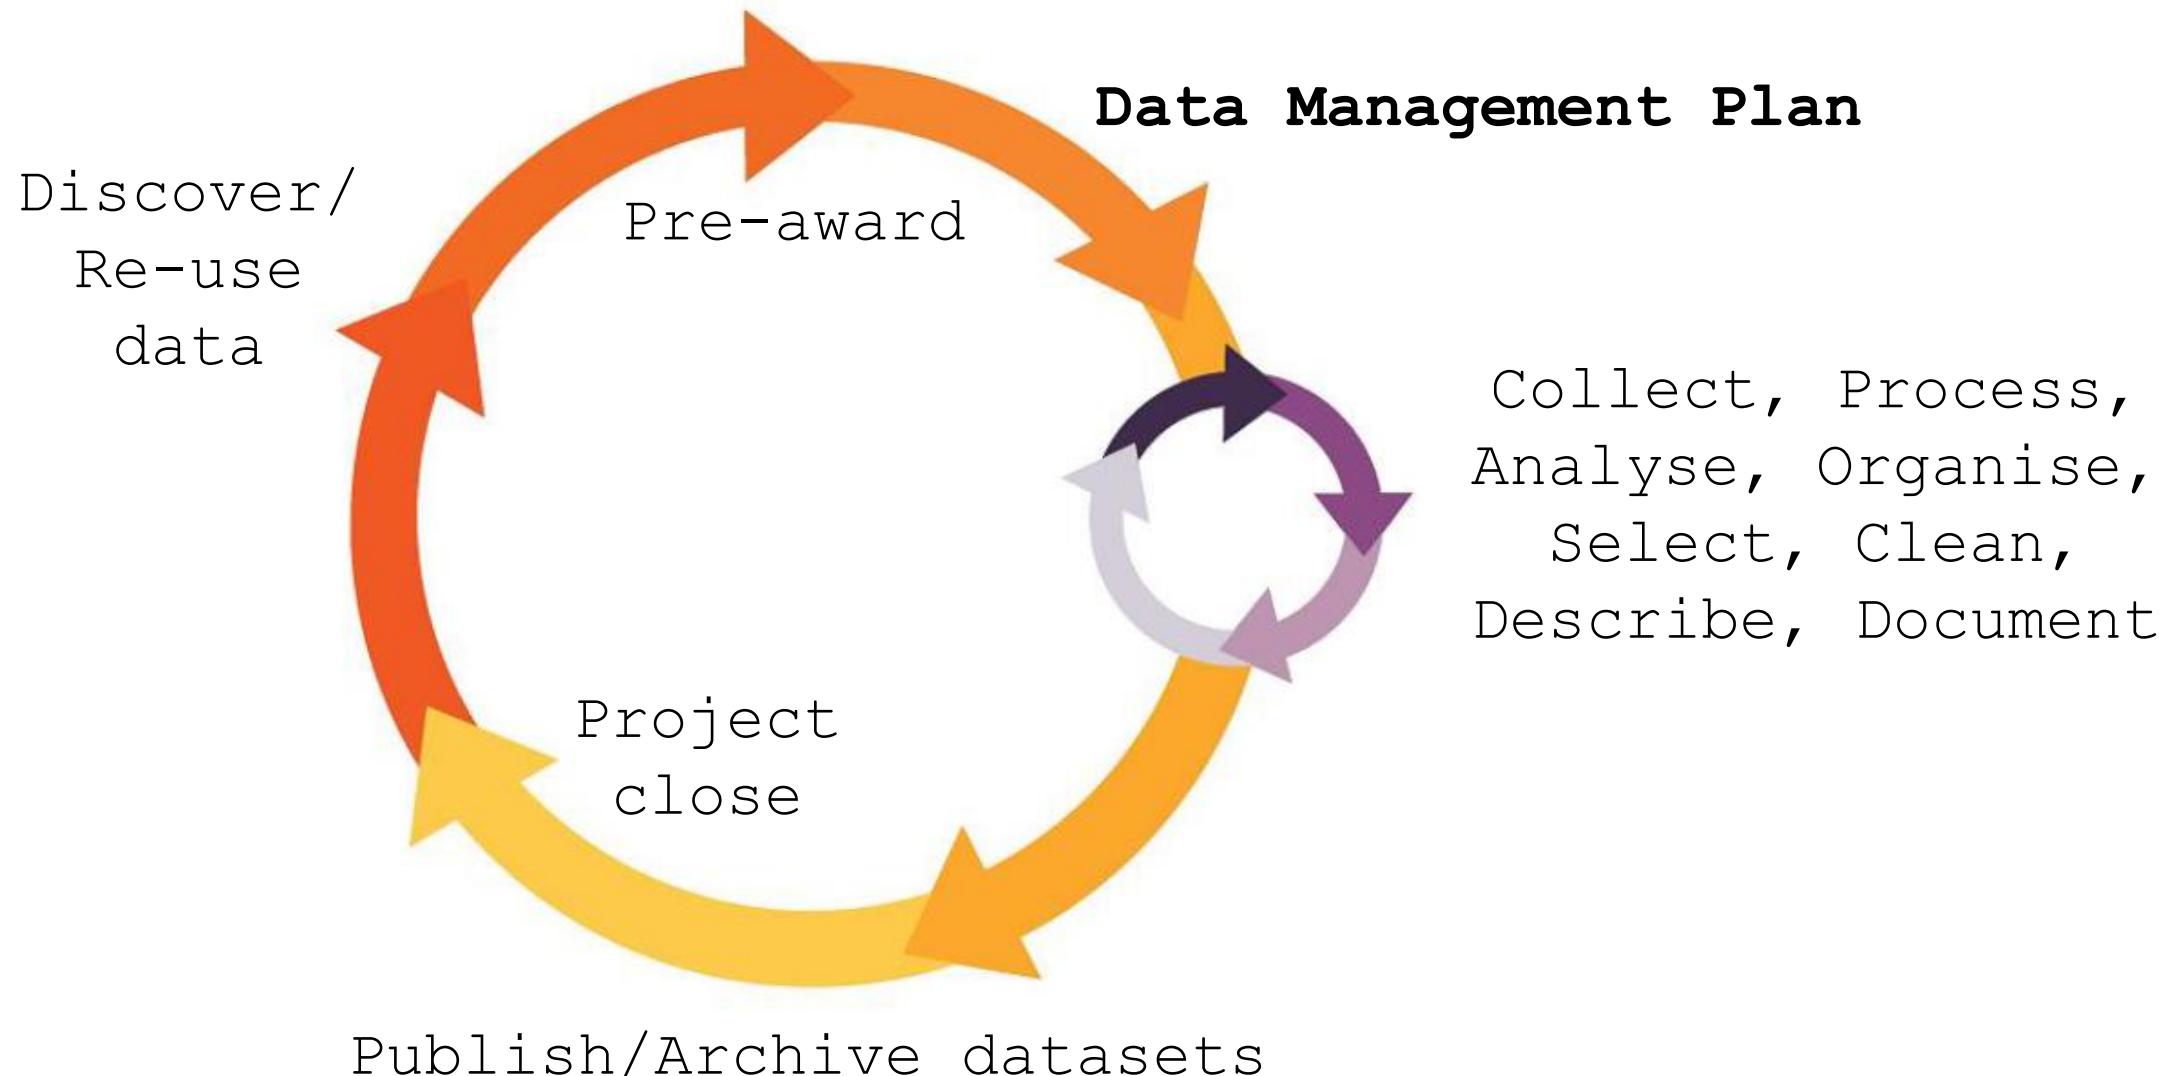

An output management plan (OMP) is a useful starting point for collecting or creating data, software, research materials, and intellectual property. Creating an OMP before you begin your research, and updating it throughout the research cycle, will help ensure that your outputs are as open and **FAIR** as possible when your project is complete.

Some funders require grant-holders to produce a plan as part of their application for funding, and/or after funding has been secured.

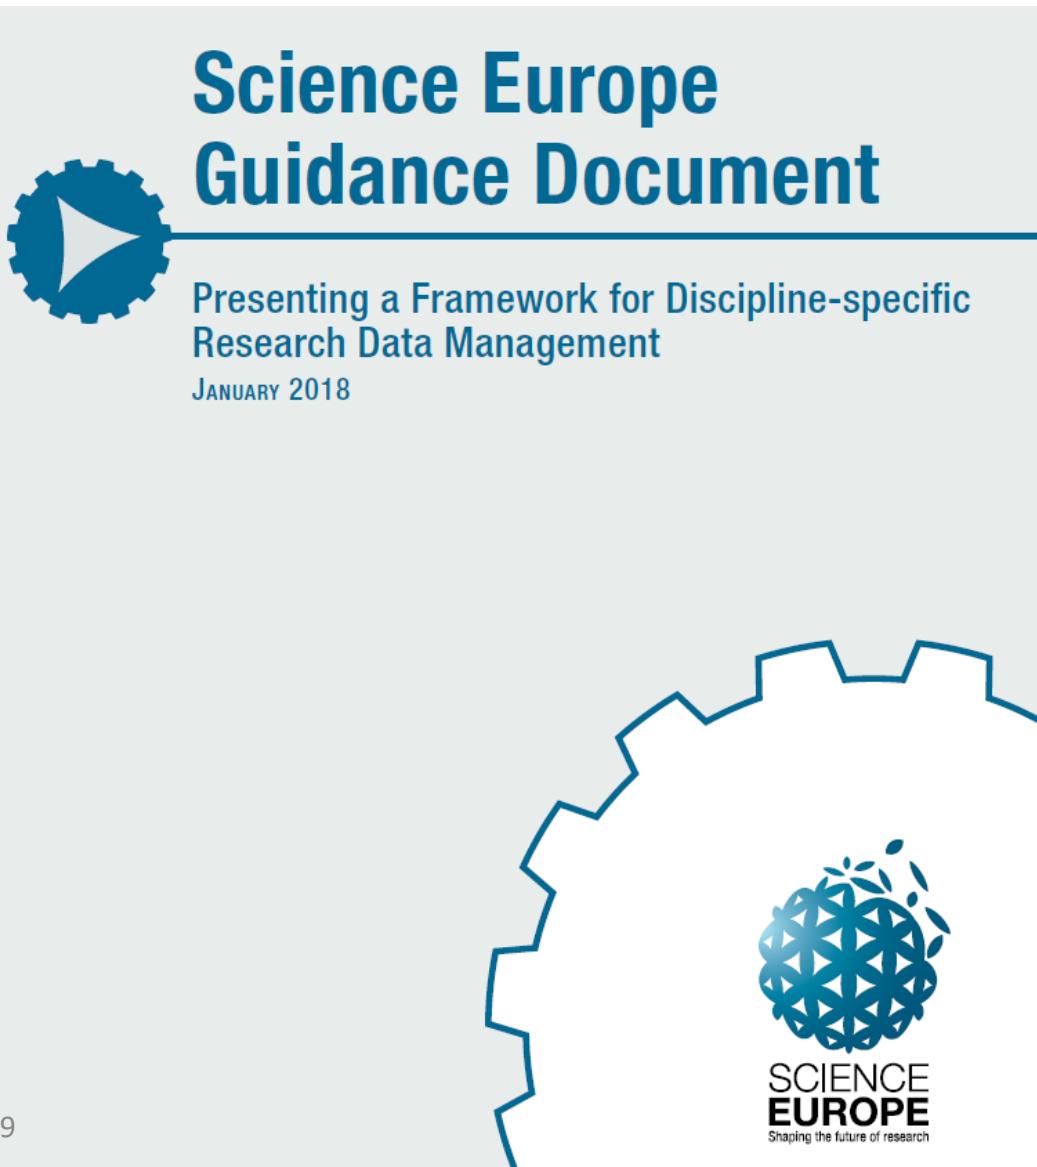

You should consider:

- What outputs you will be creating or collecting, and how these will be documented
- What ethical or legal requirements, if any, apply to the outputs
- How you will organise, store, secure, and share the outputs
- What resources are required and who is responsible

# Incorporating FAIR into your routine workflow

# It all starts with a Data Management Plan

**Seven main headings:**

1. Data collection
2. Documentation and Meta-data
3. Ethics and Legal Compliance
4. Storage and Backup
5. Selection and Preservation
6. Data Sharing
7. Responsibilities and Resources

## CEDAR Metadata Tools

When a biomedical scientist needs to upload her data and enter corresponding metadata into a repository, she is faced with a formidable task. Not only does she need to navigate and fill out many forms to enter (and re-enter!) information, and make sure everything is cross-referenced correctly, but the metadata frequently end up stored in an ad hoc manner, in a non-standard format, and using non-standard terminology. As a result, finding or reusing the metadata, or understanding the underlying experiments, becomes extremely hard, if not impossible. But when the scientist uses CEDAR, our tools can make describing laboratory studies—or metadata for any other biomedical content—much easier.

## Data Organization in Spreadsheets

Karl W. Broman<sup>a</sup> and Kara H. Woo<sup>b</sup>

<sup>a</sup>Department of Biostatistics & Medical Informatics, University of Wisconsin-Madison, Madison, WI; <sup>b</sup>Information School, University of Washington, Seattle, WA

### ABSTRACT

Spreadsheets are widely used software tools for data entry, storage, analysis, and visualization. Focusing on the data entry and storage aspects, this article offers practical recommendations for organizing spreadsheet data to reduce errors and ease later analyses. The basic principles are: be consistent, write dates like YYYY-MM-DD, do not leave any cells empty, put just one thing in a cell, organize the data as a single rectangle (with subjects as rows and variables as columns, and with a single header row), create a data dictionary, do not include calculations in the raw data files, do not use font color or highlighting as data, choose good names for things, make backups, use data validation to avoid data entry errors, and save the data in plain text files.

# Less stress, more success

The screenshot shows a Microsoft Excel spreadsheet titled "example\_data\_entry - Excel". The ribbon is visible at the top, with the "Home" tab selected. The main area displays a table of data with columns A through P. Row 146 is currently selected, and a dropdown menu is open over cell C146, showing options: "my", "ca", and "ptp". The data in the table includes numerical values, text entries like "filter", and dates/times. Some cells contain red text or numbers.

## Revisiting the decay of scientific email addresses

Posted May 12, 2019.

Raul Rodriguez-Esteban, Dina Vishnyakova, Fabio Rinaldi

doi: <https://doi.org/10.1101/633255>

This article is a preprint and has not been peer-reviewed [what does this mean?].

### Abstract

Email is the primary means of communication for scientists. However, scientific authors change email address over time. Using a new method, we have calculated that approximately 18% of all authors' contact email addresses in MEDLINE are invalid. While an unfortunate number, it is, however, lower than previously estimated. To mitigate this problem, institutions should provide email forwarding and scientific authors should use more stable email addresses. In fact, a steadily growing share already use free private email addresses: 32% of all new addresses in MEDLINE in 2018 were of this kind.

The screenshot shows the homepage of the Journal of Virology. It features the journal's logo, "AMERICAN SOCIETY FOR MICROBIOLOGY", and the title "Journal of Virology". There is a search bar and an "Advanced Search" link. A horizontal menu includes "Home", "Articles", "For Authors", "About the Journal", and "Subscribe". Below the menu, a link to "Genetic Diversity and Evolution | Spotlight" is visible.

## Single-Cell Virus Sequencing of Influenza Infections That Trigger Innate Immunity

Finally, we process the annotated cell-gene matrix in R to generate the plots shown in this paper. This analysis utilized a variety of R and Bioconductor ([90](#)) packages, including Monocle ([91](#), [92](#)) and ggplot2. A Jupyter notebook that performs these analyses is at

## Figures for paper

We have made all of the plots above, and saved some of them to the figures directory already by using the `isfig=TRUE` argument to `saveShowPlot`. However, there are others that we want to assemble into multi-panel figures. We do that here.

First, we assemble a figure that shows the calling of cells, infected cells, and IFN+ cells:

```
In [101]: p_cell_summary <- plot_grid(
  plot_grid(p_cellcounts, p_fiu_vs_cell,
            ncol=1, rel_heights=c(1, 1.5), scale=0.9,
            labels=c("A", "B"), label_size=18, vjust=1),
  plot_grid(p_frac_fiu, labels="C", scale=0.95, label_size=18, vjust=1),
  plot_grid(p_nfui_genes, labels="D", scale=0.95, label_size=18, vjust=1),
  plot_grid(p_fiu_rel_expr, p_cinfect,
            scale=0.95, ncol=1,
            labels=c("E", "F"), label_size=18, vjust=1),
  plot_grid(p_ifn_dist, labels="G", scale=0.95, label_size=18, vjust=1),
  nrow=1, scale=0.95, rel_widths=c(1, 0.7, 0.6, 0.75, 0.7), align="h"
) +
  theme(plot.margin=unit(c(t=0, r=0, b=-0.3, l=0), "in"))

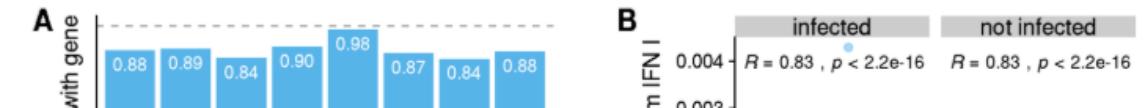

saveShowPlot(p_cell_summary, width=15.5, height=4.9, isfig=TRUE)
```

Now a supplementary figure to the one above with the single-cell transcriptomic data:

```
In [102]: p_cell_summary_supp <- plot_grid(
  p_frac_has_gene,
  p_ifn_genes_corr,
  p_isg_dist,
  p_isg_corr,

**Dr Brendan Palmer**

The image is a screenshot of the University College Cork (UCC) Library Research Data Service website. At the top, there is a dark blue header bar with white text. From left to right, it contains: a small logo, the text 'UCC | Library LEABHARLANN', a search bar with the placeholder 'Search this site' and a 'Search' button, and three small icons. Below the header is a light grey navigation bar with several links: 'Home', 'Subject Support', 'Services', 'Ask Us', and 'My Account'. The main content area has a white background. At the top of this area, there is a search bar. Below the search bar, the text 'Research Data Service: Home' is displayed. Underneath this, a smaller line of text reads 'We are a university wide resource which supports and promotes best practice in data management.' At the bottom of the main content area, there is a horizontal navigation menu with five items: 'Home' (which is highlighted in blue), 'Data Management Planning', 'FAIR', 'Training and Support', and 'Open Science'. Below this menu is a large, light-grey rectangular box containing the text 'Research Data Service' in a large, bold, black font. The text is centered and surrounded by a decorative border made of small diamond-shaped arrows pointing outwards.
